                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4 GPHRS 8
C. Natl. Acad. Sci. U.S.A. 99:996-1001(2002).
FUNCTION: Associates with free 30S ribosomal subunits (but not with 30S subunits that are part of 70S ribosomes or polysomes).
Essential for efficient processing of 16S rRNA. May interact with the 5'terminal helix region of 16S RRna (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PROTEIN FROM CARLAVIRUSES.

J. 147:291-302(1975).

FUNCTION: Electron carrier protein. The oxidized form of the cytochrome c heme group can accept an electron from the heme group of the cytochrome cl subunit of cytochrome reductase. Cytochrome then transfers this electron to the cytochrome oxidase complex, the final protein carrier in the mitochondrial electron-transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EUGGR

                                                                                                                                                                                                                                                                  INCREASE IN CANCER SUSCEPTIBILITY. IT IS CHARACTERIZED BY A
FAMILIAL PREDISPOSITION TO EARLY ONSET COLORECTAL CARCINOMA (CRC)
AND EXTRA-COLONIC CANCERS OF THE GASTROINTESTIAL, UNCLOSICAL AND
FEMALE REPRODUCTIVE TRACTS. HNPCC IS REPORTED TO BE THE MOST
COMMON FORM OF INHERITED COLORECTAL CANCER IN THE WESTERN WORLD.
CANCERS IN HNPCC ORIGINATE WITHIN BEBRIGN NEOPLASTIC POLYPS TERMED
ADENOMAS. CLINICALLY, HNPCC IS OFTEN DIVIDED INTO TWO SUBGROUPS.
TYPE I: HEREDITARY PREDISPOSITION TO COLORECTAL CANCER, A YOUNG
AGE OF ONSET, AND CARCINOMA OBSERVED IN THE PROXIMAL COLON. TYPE
II: PATIENTS HAVE AN INCREASED RISK FOR CANCERS IN CERTAIN TISSUES
SUCH AS THE UTERUS, OVARY, BREAST, STOMACH, SMALL INTESTINE, SKIN,
AND LARRYNX IN ADDITION TO THE COLON. DIAGNOSIS OF CLASSICAL HAPCC
IS BASED ON THE ANSTERDAM CRITERIA: 3 OR MORE RELATIVES AFFECTED
BY COLORECTAL CANCER, ONE A FIRST DEGREE RELATIVE OF THE OTHER
TWO; 2 OR MORE GENERATION AFFECTED; 1 OR MORE COLORECTAL CANCERS
PRESENTING BEFORE 50 YEARS OF AGE; EXCLUSION OF HEREDITARY
POLYPOSIS SYNDROMES. THE TERM "SUSPECTED HAPCC" CAN BE USED TO DESCREE FAMILIES WHO DO NOT OR ONLY
PARTIALLY FULFILL THE AMSTERDAM CRITERIA, BUT IN WHOM A GENETIC
STMILABITY. REPLONGS TO THE DAM ATSMACH EPERALD MUTILIFES EAMILY

"Structure of the receptor for platelet-derived growth factor hel define a family of closely related growth factor receptors.";

Nature 323:226-232(1986).

-!- FUNCTION: THIS RECEPTOR BINDS PLATELET-DERIVED GROWTH FACTOR HAS A TYMOSINE-PROTEIN KINASE ACTIVITY. THIS RECEPTOR BINDS SPECIFICALLY TO PDGF-B.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine - ADP + protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ø
PATHWAY: Cyclic nucleotide metabolism.

TISSUE SPECIFICITY: HIGHEST LEVELS IN TESTIS > EYE > LIVER > SKELETAL MUSCLE > HEART > 7-DAY EMBRYO > KIDNEY > OVARY > BRAIN. IN THE TESTIS, EXPRESSED SPECIFICALLY IN THE SEMINIFEROUS EPITHELIUM IN A SPATIAL AND TEMPORAL MANNER.

DEVELOPMENTAL STAGE: LEVELS OF EXPRESSION DEFERES SOMETIME BETWEEN EMBRYO DAY 7 AND DAY 11. IN THE TESTIS, EXPRESSION RESTRICTED TO MIDDLE AND LATE PACHYTENE SPERMATOCYTES.

DOMAIN: COMPOSED OF A C-TERMINAL CATALYTIC DOMAIN COMPAINING TWO PUTATIVE DIVALENT METAL SITES AND AN N-TERMINAL REGULATORY DOMAIN. SIMILARITY: BELONGS TO THE CYCLIC NUCLEOTIDE PHOSPHODIESTERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C. Natl. Acad. Sci. U.S.A. 95:8991-8996(1998).

FUNCTION: PLAYS A ROLE IN SIGNAL TRANSDUCTION BY REGULATING THE FUNCTION PLAYS A ROLE IN SIGNAL TRANSDUCTION BY REGULATING THE INTRACELLULAR CONCENTRATION OF CYCLIC NUCLEOTIDES. THIS PHOSPHODIESTERASE, WHICH HAS A HIGH AFFINITY FOR CAMP, MAY BE INVOLVED IN MAINTAINING BASAL LEVELS OF THE CYCLIC NUCLEOTIDE AND/OR IN THE CAMP REGULATION OF GERM CELL DEVELOPMENT.

CATALYTIC ACTIVITY: Adenosine 5'-cyclic phosphate + H(2)O = adenosine 5'-phosphate.

COPACTOR: REQUIRES DIVALENT CATIONS. MAGNESIUM OR MANGANESE COPACTOR: REQUIRES DIVALENT CATIONS.

"Cloning of Xenopus presentiin-alpha and -bety conests.";

differential expression in ogenesis and embryogenesis.";

Biochem. Biophys. Res. Commun. 231:392-396(1997).

-1- FUNCTION: MAY PLAY A ROLE IN REGATIVE REGULATION OF APOPTOTIC CASCADES DURING COGENESIS AND EMBRYOGENESIS, AND IN

DEVELOPMENTALLY MATURED TISSUES SUCH AS BRAIN TISSUE.

-1- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

-1- TISSUE SPECIFICITY: HIGHEST EXPRESSION IN OVARIES AND TO A LESSER EXTENT IN TESTIS, INTESTINE, KIDNEY, BRAIN, EYE AND LUNG. WEAK FYDRRESSTON IN LIVER AND HEART. PRESENT IN TRACE AMOUNTS IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-JUL-1999 (Rel. 38, C

-! FUNCTION: MAY PLAY A ROLE IN INTRACELLULAR SIGNALING AND GEIEXPRESSION OR IN LINKING CHROMATIN TO THE NUCLEAR MEMBRANE.

MAY FUNCTION IN THE CYTOPLASMIC PARTITIONING OF PROTEINS.

-! SUBUNIT: PREDOMINANTLY HETERODIMER OF A.-TERMINAL (NTF) ANI C-TERMINAL (CTF) ENDOPROTEDLYTICAL FRAGMENT (BY SIMILARITY) ANI C-TERMINAL (CTF) ENDOPROTEDLYTICAL FRAGMENT (BY SIMILARITY).

-! SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. GOLGI AND ENDOPLASMIC RETICULUM (BY SIMILARITY).

-! ALTERNATIVE PRODUCTS: 2 ISOFORMS; I-467 (SHOWN HERE) AND I-463; ARE PRODUCED BY ALTERNATIVE SPLICING.

-! TISSUE SPECIFICITY: FOUND PREDOMINANTLY IN NEURONS OF THE DIFFERENT CORTICAL LAYERS AND HIPPOCAMPUS BUT ALSO IN SUBCOLUMENTS.
                                                                                                                      SITE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).

                           "Molecular cloning and tissue distribution of presentiin-1 in
senenscence accelerated mice (SAM P8) mice.";

Submitted (MAY-1999) to the EMEL/GenBank/DDBJ databases.

C -!- FUNCTION: MAY PLAY A ROLE IN INTRACELLULAR SIGNALING AND GENE
EXPRESSION OR IN LINKING CHROMATIN TO THE NUCLEAR MEMBRANE.

C MAY FUNCTION IN THE CYTOPLASMIC PARTITIONING OF PROTEINS.

C -!- SUBUNIT: PREDOMINANTLY HETERODIMER OF A N-TERMINAL (NTF) AND A

C -TERMINAL (CTF) ENDOPROTEOLYTICAL FRACMENT (BY SIMILARITY).

C -!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. GOLGI AND
ENDOPLASMIC RETICULUM (BY SIMILARITY).

C -!- SIMILARITY: BELONGS TO THE PRESENLIN FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BG
